Shetrant

We describe a conferencing system designed to provide real-time, multiparty, fully interact services in a LAN environment. The requirements of the multimedia conferencing service as follows. First, there are a number of participants, and the number of participants varies service duration. So there must be a provision which allows members to join and leave a each multimedia data has its own characteristics, and they have very close relationships the quality of service (QoS) requirements of each media must be satisfied separately, and their relationship first be maintained at playback time. For example, the audio and video c synchronized at playback time. Considering the above requirements, we designed a mult conferencing system. It is mainly composed of two control entities: the group manager ar group manager controls and maintains the participants group according to group attribute manager performs call admission control according to its anticipation of network states at and controls the media data sending rate based on the receivers' periodic media receptio more efficient control, we take into consideration the group characteristics in the media of Feasibility has been confirmed by laboratory trials
